

Grease Guardian[®]

FOG Recovery Units

Each year millions of tons of Fats, Oils, and Grease (FOG) enter the facility's drainage plumbing and the local municipal sewer system. FOG will stick to pipes, valves, manholes, and pump stations. Eventually, blockages occur, which cost operational difficulties and money.

Grease Guardian®

FOG gets just about everywhere and can seriously damage treatment infrastructure, costing owners of on-site systems or municipalities millions of dollars in repairs every year. If FOG is allowed to enter the on-site soil dispersal system or natural water courses will cause obvious damage to the environment. FOG Recovery Units can be installed to trap and remove FOG at the source before any damage is caused.

Grease Guardian FOG Recovery Units are built to last. Proven, industry leading design, takes industrial pre-treatment of FOG to a professional level. All operational components of the Grease Guardian are managed by a Programmable Logic Controller (PLC) for maximum reliability and operational flexibility.

Applications

Restaurants

Hotels

Hospitals

Airports

Schools and Universities

Food Courts

Convenience Stores

Delis

Grocery Stores

Why Choose Grease Guardian?

- Recover and recycle fats, oils, and grease
- Up to 99% FOG removal
- Reduce grease tank pump out costs
- Insurance for downstream plumbing and treatment components
- Quality built stainless steel construction
- Concealed plumbing and electrical connections
- Fully sealed air tight lid
- Universal flow direction
- Flexible installation
- Scalability
